

Digital Privacy Intelligence Platform: Business Strategy Report

Day 24 · 9 Oct 2026 · India-first · Stage: pre-validation student project Source of truth: Day 23 Customer & MVP Blueprint (built on the Day 22 Startup Validation Report).

Labels: **FACT** you told me, or a cited source · **ESTIMATE** inferred or calculated · **ASSUMPTION** needs validation · **UNKNOWN** cannot be determined from available information.

Standing rule for this report: there is a prototype, and nothing else. **FACT** 0 confirmed external users, 0 paying customers, \$0 revenue, 0 interviews. Every revenue number below is an arithmetic illustration or an experiment threshold, not a forecast. ₹99/month and ₹499/year are unvalidated pricing hypotheses.

1. Executive Summary

Item	Summary
Business	A privacy check-up for Indian users: pick your apps, get a sourced score and three ordered actions. FACT (Day 23)
Evidence	FACT One prototype (15 services, model-estimated scores). No external users, interviews, surveys, waitlist, or revenue.
Two business models, kept separate	Consumer: free core plus a possible Pro tier (₹99/month or ₹499/year, unvalidated). Institutional: a cyber-hygiene program sold to colleges (price UNKNOWN).
First segment to test	Final-year undergraduate students at Indian colleges, including non-CS students, who use UPI and many apps daily. ASSUMPTION
Main channel to test	Campus cyber-awareness sessions run with college cyber clubs or IT cells. ASSUMPTION
Why this channel	A verified hook exists: UGC asked higher-education institutions to observe a monthly "Cyber Jagrookta Diwas" (notice of 18 Nov 2021), and Delhi University signed an MoU with I4C on cyber hygiene in July 2026. FACT Whether colleges still run these sessions, and whether they pay for tools, is UNKNOWN .
Biggest finding	Consumer subscriptions alone are unlikely to carry this business. At the Day 22 reach estimate (5,000 users, 3% paying, ₹499/year) revenue is about ₹74,850 a year. ESTIMATE The institutional route may be larger, but its budget is unproven.
Verdict	VALIDATE. Not investable today, not worth rejecting. Test institutional demand and real user actions before building anything else.

2. Business Reality Check

Question	Honest answer	Status
Who pays today?	Nobody. 0 payers.	FACT
Who might pay?	(1) Individual students: weak, low budgets, free alternatives. (2) Colleges or universities running cyber-awareness programs. (3) Employers of early-career staff: not researched.	ASSUMPTION
Why would they pay?	Individuals: peace of mind, change alerts, new-app checks. Colleges: a ready-made, measurable cyber-hygiene activity for students.	ASSUMPTION
How do customers discover the product?	Today, they do not. Planned: a free campus session, then the check-up link, then the shareable result card.	ASSUMPTION
Is there a demand signal?	Only concern, not behavior: nearly two in three Indian smartphone users say they have seen ads that seemed linked to private voice conversations (LocalCircles via Moneylife; sample size and date not retrieved).	FACT as reported
Closest precedent	Jumbo Privacy, a venture-funded consumer privacy app, reported 25,000 paid subscribers and 40% annual churn, then removed its paywall and signalled a B2B move.	FACT as reported

Biggest risks (from Day 23): (1) the score is not trusted or accurate; (2) people see it but do not act or return; (3) your reach skews to coders, so early demand may be overstated; (4) no willingness to pay; (5) data upkeep and scope creep.

Weak assumptions that this report does not rely on:

Weak assumption	Why it is weak	Test
Students will pay ₹99/month or ₹499/year	No evidence; free alternatives; reported consumer churn of 40%	Fake-door click test
Colleges have a budget for a tool	The 2021 UGC notice concerned awareness activities, and the article said state governments would provide budgets for them. Budget for software is UNKNOWN .	Ask 5 institution contacts what they spend on similar activities
Colleges still run monthly cyber-awareness sessions	The notice is from 2021 and was framed for online delivery during the pandemic	Ask during the first conversations
A score that people see will make them act	Awareness has not reliably produced action	7-day action follow-up
Your first users represent the market	Coding communities and LinkedIn skew privacy-aware	Recruit at least half outside coding circles

3. Business Model Canvas

Two separate models. The consumer model is the funnel and the learning engine. The institutional model is the main monetization hypothesis. Neither is validated.

Block	Consumer model	Institutional model
Customer segment	Final-year students and first-job professionals, 20–25 ASSUMPTION	Colleges and universities; cyber clubs and IT cells as entry contacts ASSUMPTION
Value proposition	A 2-minute check-up with three ordered, sourced actions	A ready-made cyber-hygiene activity with a measurable student outcome (actions completed)
Channels	Campus sessions, shareable result card	Direct outreach to cyber clubs, faculty coordinators, IT cells
Customer relationship	Self-serve; one manual 7-day follow-up	Relationship-led pilot with a named coordinator
Revenue streams	Free core; possible Pro (₹499/year, ₹99/month hypotheses)	Pilot fee, per-session fee, or per-student license (price UNKNOWN)
Key resources	Prototype, sourced service dataset, method page	Same, plus a session format and an outcome report
Key activities	Source data, run sessions, follow up, interview users	Sell pilots, run sessions, report outcomes
Key partners	College cyber clubs; one security practitioner to review the method	Faculty coordinators; potentially I4C-linked programs (a Delhi University MoU exists)
Cost structure	Hosting and payment fees UNKNOWN ; founder time (not costed)	Travel and session time UNKNOWN
Status	0 users, 0 payers	0 conversations held

4. Revenue & Pricing Strategy

4.1 Consumer pricing (hypotheses only)

Plan	Hypothesis	Status
Free	Check-up, sources page, top three actions	ASSUMPTION
Pro	₹499/year or ₹99/month: change alerts, new-app checks, ongoing plan	Unvalidated pricing hypothesis

4.2 Consumer revenue illustration (annual plan at ₹499; users, paying share, and price are experiment inputs, not forecasts)

Registered users	0% pay	1% pay	3% pay
100	₹0	1 payer = ₹499	3 payers = ₹1,497
1,000	₹0	10 payers = ₹4,990	30 payers = ₹14,970
5,000	₹0	50 payers = ₹24,950	150 payers = ₹74,850

Reading: even the top row of reach and conversion is a few thousand rupees a month at most. **ESTIMATE** Monthly plans would also face churn; Jumbo's reported 40% annual churn is a warning. **FACT** as reported

4.3 Institutional pricing (price [UNKNOWN])

Option	Description	What to learn
Free pilot, then paid	One free session; paid program after outcome report	Will they commit after seeing results?
Per-session fee	A workshop and check-up for a cohort	What similar activities cost them today
Per-student annual license	A fee per enrolled student	Who approves it and what budget line it comes from

Illustrative arithmetic only, using a placeholder price, not evidence: a college with 2,000 students at ₹50 per student per year would be ₹1,00,000 per year; 10 such colleges would be ₹10,00,000. **ASSUMPTION** The ₹50 figure is invented for the sum and must be replaced by what institutions say they pay.

4.4 Verified anchors: Incogni Standard costs \$95.88/year on annual billing. **FACT** It is a data-broker removal service and its India coverage is **UNKNOWN**.

Pricing tests: fake-door "Pro" button (₹99/month and ₹499/year); Van Westendorp questions in the survey; ask 5 institution contacts what they spend on awareness activities. Do not set a price until at least one of these returns data.

5. Go-To-Market Strategy

Decision	Recommendation	Status
Initial customer segment (one)	Final-year undergraduate students at Indian colleges, including non-CS students	ASSUMPTION
Main distribution channel (one)	Campus cyber-awareness sessions with cyber clubs or IT cells	ASSUMPTION
First monetization to test	Institutional pilot (ask for a pilot, not a purchase)	ASSUMPTION
Second monetization to test	Consumer Pro through a fake-door button	ASSUMPTION

GTM flow (one path): Cyber club or IT cell agrees to host → free 30–45 minute session → attendees open the check-up → three sourced actions → 7-day follow-up → day-14 return prompt → fake-door Pro button and a pilot conversation with the host institution.

Verified hooks for this channel

- UGC asked colleges, universities, and other higher-education institutions to observe Cyber Jagrookta Diwas monthly; the suggested slot was the first Wednesday, 11am, one hour, online (notice of 18 Nov 2021). **FACT**
Current practice is **UNKNOWN**.
- UGC requested institutions to implement its cyber security syllabus at UG and PG level (launched 6 Oct 2022); the article describes a request, not a mandate. **FACT**
- Delhi University and I4C signed an MoU covering cyber hygiene, awareness programs, workshops, and student participation (reported 13 Jul 2026). **FACT**

Deprioritized for now: coding communities and LinkedIn (use for interviews only, because of sampling bias), paid ads, app-store listings, content marketing. One channel is enough for a first test.

6. Customer Acquisition Strategy

Stage	Tactic	Cost	Metric (experiment)
Find hosts	Message 20 cyber club leads, faculty coordinators, or IT cells with a one-line offer: a free 30-minute session on protecting accounts and payments	Founder time; other costs UNKNOWN	≥ 5 replies; ≥ 2 sessions booked
Run session	Short talk, live check-up for attendees, collect sources page feedback	Travel or online; UNKNOWN	Attendees per session; check-up completion
Convert	Attendees complete the check-up on their phones	None	≥ 40% of attendees complete it
Activate	7-day follow-up message	None	≥ 50% of users report an action
Expand	Share the result card without the app list	None	Shares per user
Monetize	Fake-door Pro; pilot conversation with host	None	≥ 5% click; ≥ 1 pilot interest

Unit economics: acquisition cost per user and per institution is UNKNOWN until you log hours and travel per session. Track them from session one.

Rule for counting users: a user is a non-friend who completes the check-up. Interview participants count only if they complete it themselves.

7. First 100 Users Plan

All numbers are experiment targets with stated assumptions. They are not forecasts.

Source	Target users	Assumption
Student interviews (invited to complete the check-up)	15	All 15 complete it
Personal and community network	15	Warm contacts; likely biased, so tracked separately
Campus sessions	72	4 sessions × 40 attendees × 45% completion = 72
Total	~100	15 + 15 + 72 = 102

Timeline	Action	Done when
Days 1–10	Contact 20 hosts; run 15 interviews; fix the service list and sources page	≥ 2 sessions booked; check-up v1 live
Days 11–21	Sessions 1 and 2; 7-day follow-ups begin	≥ 30 completed check-ups from sessions
Days 22–35	Sessions 3 and 4; fake-door pricing; pilot conversations	≥ 72 from sessions or reasons recorded
By Day 45	100 completed check-ups from non-friends	Count reached, or stop and diagnose

Funnel thresholds (pass signals, not forecasts): 160 attendees → 72 check-ups (45%) → about 36 act within 7 days (50%) → about 14 return by day 14 (20%) → about 4 click the Pro option (5%).

Rules: no purchased or fake users; report friends and non-friends separately; log why people drop off.

8. Competitive Position & Moat

Only verified facts are stated. Everything else is UNKNOWN.

Alternative	What it is	Pricing	Where it beats you	Where you could differ
ToS;DR	Community-reviewed A–E grades for terms and privacy policies; browser extensions	Free FACT	Transparent, volunteer-reviewed	Personalized actions; India-relevant services
Exodus Privacy	Lists trackers embedded in Android apps	UNKNOWN	Checks the app itself	Non-technical output, ordered plan
Google privacy tools	Privacy Checkup, My Activity, auto-delete, Download Your Data	Free FACT	Built into the services users already use	Cross-company view
Incogni	Data-broker removal, 420+ brokers	\$95.88/year annual FACT	Does the removal for you	Different problem (awareness, not removal)
Jumbo Privacy	Consumer privacy app; removed paywall	Current UNKNOWN	Had funding and active controls	Cautionary precedent
Doing nothing	Accept the exposure	Free	Zero effort	Your real competitor

Possible moat	Today	What would build it
Sourced India-specific dataset	None. Current scores are model estimates.	Cited, reviewed data for 20–25 services, then more
Institutional relationships	None	Pilots and referrals from hosts
Trust and transparency	Low	Public method, expert review, open ratings
Switching costs	None	Not obvious for a consumer product
Regulatory tailwind	UNKNOWN	The DPDP Rules were notified 14 Nov 2025 and phase in over 12–18 months; whether this creates demand for you is unproven

Conclusion: there is no moat today. A moat could emerge from verified data plus institutional relationships, and both are slow to build and easy to lose if left unmaintained.

9. Reverse SWOT Analysis

A reverse SWOT challenges each item. Strengths are tested as possible weaknesses, and weaknesses as possible leverage.

Standard item	Reverse view	Action
Strength: you can build and iterate alone	Building is not the bottleneck; demand and trust are. Building more is a way to avoid interviews.	Cap build time; interviews first
Strength: you are in the target group	Your habits are one data point and may bias your design	Interview people unlike you
Weakness: no security credibility	Honest transparency can be a trust asset: publish sources and limits	Public method; expert review
Weakness: no startup experience	Low burn and no sunk pride make quick stops cheap	Set kill criteria now
Opportunity: India's data-protection rules	A regulation is not a customer; companies, not students, carry most obligations	Treat it as a trigger, not demand
Opportunity: UGC and I4C awareness activity	Awareness activity may be unpaid and handled by free resources	Ask what they pay for
Threat: free alternatives	Free tools may already be good enough; their existence does not prove a gap	Ask users what they have tried and what still hurts
Threat: platforms add cross-service views	Platforms may have little incentive to compare themselves with rivals ASSUMPTION	Keep the cross-company view as the test of a real gap

10. Investor One-Liner

Draft hypothesis, not a traction claim: "A free, sourced privacy check-up for Indian college students that turns their app list into three actions, delivered through campus cyber-awareness sessions and offered to colleges as a cyber-hygiene program."

11. 30-Second Founder Pitch

Draft for a conversation, about 80 words:

"Most students use ten or more apps daily and have no idea what to fix first. I built a prototype that turns your app list into three sourced actions in two minutes. I haven't proven demand yet, so I'm running a 30-day test: campus sessions with cyber clubs, real follow-ups on whether people act, and a pilot conversation with colleges. By day thirty I'll know whether students act, whether anyone pays, and whether colleges will run it."

12. Investment Scorecard (0–100)

All scores are **ESTIMATE** judgments, not measurements.

Dimension	Score	Reasoning	What would raise it (experiment)
Business Viability	30	Low cost to test; no evidence of a paying customer	≥ 1 institution agrees to a paid or formal pilot
Revenue Potential	25	Consumer revenue is small at realistic reach; institutional price and budget UNKNOWN	A stated price range from ≥ 3 institutions
GTM Strength	35	One plausible channel with verified hooks, but unproven and untested	≥ 2 sessions booked and ≥ 40% completion
Competitive Strength	20	No moat; free alternatives; data is estimated	Sourced, reviewed data for 20–25 services
Investor Readiness	10	Student project, 0 traction, solo founder	≥ 100 real users, ≥ 1 paid pilot, a clear segment
Simple average	24	Equal weights, my choice	

13. Founder Action Sheet: Top 10 Actions

#	Action	By	Done when
1	Write kill and continue thresholds (Section 14) before testing	Day 1	Saved
2	List 20 cyber clubs, faculty coordinators, or IT cells to contact	Day 2	List complete
3	Send the one-line session offer to all 20	Day 3	20 sent
4	Run 15 student interviews, at least half outside coding circles	Day 7	15 logged
5	Ask 5 institution contacts: do you still run cyber-awareness sessions, and what do you spend?	Day 10	Answers recorded
6	Fix the service list and add a sources page for each service	Day 12	20–25 sourced services
7	Run sessions 1 and 2; log hours, travel, attendance, completions	Day 21	Numbers recorded
8	Send 7-day follow-ups; add the fake-door Pro button	Day 28	Action rate and click rate known
9	Ask each host for a pilot conversation	Day 28	≥ 1 yes or reasons logged
10	Write the decision memo and ask one security practitioner to review the method	Day 30	Decision made

14. 30-Day Business Validation Plan

Days	Focus	Actions	Experiment threshold
1–7	Demand and buyer discovery	Contact 20 hosts; 15 student interviews; 5 institution conversations begin	≥ 5 host replies; ≥ 40% of interviewees describe a real incident or action
8–14	Trust and product	Sourced dataset for 20–25 services; three-action result page; follow-up form; method review request	Every claim cited
15–21	Real user actions	Sessions 1–2; 7-day follow-ups; start counting users	≥ 30 check-ups; ≥ 50% report an action
22–30	Willingness to pay	Sessions 3–4; fake-door pricing; pilot ask; decision memo	≥ 5% click Pro; ≥ 1 pilot interest; price ranges from ≥ 3 institutions

Decision rule (experiments): *Continue* if users act (≥ 50%) and either ≥ 5% click Pro or ≥ 1 institution wants a pilot. *Pivot* to open ratings or a data-rights tool if users are interested but nobody pays. *Pause* if fewer than 20% act or nobody outside your circle completes the check-up. **ASSUMPTION** thresholds; set your own before starting.

15. Final Verdict

Option	Meaning	Selected
Investable	Evidence of traction and revenue	No
Validate	Plausible, cheap to test, unproven	Yes
Pivot	Evidence points to another direction	Not yet
Reject	Evidence says stop	Not yet

Verdict: VALIDATE. There is no traction, no paying customer, and no moat. The case for testing is low cost, a reachable first segment, and a verified institutional hook that no one has yet tested for willingness to pay.

Critique of this Report

Reviewed before finalizing, for unsupported claims and unrealistic assumptions:

Issue found	Treatment
Institutional budget could look established because UGC asked colleges to run awareness days	The UGC notice concerned activities, not software purchases. Budget is marked UNKNOWN and is test item 5.
The 2021 UGC notice may be outdated	Marked UNKNOWN for current practice; first question in host conversations
The ₹50 per student figure could be read as market data	Labeled a placeholder for arithmetic only; must be replaced
Funnel rates (45% completion, 50% action, 20% return, 5% click) are not evidence	Labeled as thresholds and experiments, not forecasts
Channel choice rests on one verified hook	Called an assumption; one channel only, to keep the test clean
Scores can appear precise	Labeled estimates with simple averaging and a stated reason for each
Pitch language could imply traction	Rewritten to state that demand is unproven
DPDP regulation could be read as demand	Reframed as a trigger, not a customer
Competitor details beyond verified facts	Marked UNKNOWN ; no competitor traction or pricing invented
Remaining weakness	The student segment and the institutional buyer have not been interviewed, so both are hypotheses

Sustainability Verdict

On current evidence the business is **not yet sustainable**: it has no paying customer, consumer revenue at realistic reach is small, and the institutional route has a verified awareness hook but an unproven budget. Whether it can become sustainable depends on three things to validate next: that students act on a sourced plan, that at least one college will run a paid or formal pilot, and that you can produce trustworthy, maintained data. Run the 30-day test before building anything more.
