

Digital Privacy Intelligence Platform: Customer & MVP Blueprint

8 Oct 2026 · India · Stage: pre-validation student project · Built from the Day 22 Startup Validation Report and your prototype description. No new customer data exists, so every customer detail below is a hypothesis to test.

FACT you told me, or a cited source **ESTIMATE** inferred **ASSUMPTION** needs validation
UNKNOWN not determinable

BOTTOM LINE

●

Promising but Unvalidated (low end). Build a 2-week "Privacy Check-up" test, not a platform.

The first MVP should answer one question: do real people act on a privacy plan within a week? It reuses your prototype, adds sources and India-relevant services, and adds a manual 7-day follow-up. Everything else waits for evidence.

1. Executive Summary

ITEM	EXTRACTED FROM YOUR DAY 22 REPORT
Startup idea	FACT A dashboard where users pick the apps and services they use and get a privacy score, risk insights, and an ordered improvement plan.
Problem	FACT (your framing) Privacy information is scattered across settings and policies; people cannot see combined exposure or know what to fix first.
Target customers	FACT Students and young professionals, 18–30, India-first. A hypothesis, not a proven segment.
Competitors	Closest analogues: ToS;DR (free community grades) and Exodus Privacy (Android tracker reports). Precedent: Jumbo Privacy (reported 25,000 paid subscribers and 40% annual churn, then dropped its paywall). Alternatives: Google's built-in privacy tools, Incogni-type data-broker removal (\$95.88/year on annual billing), guides, and doing nothing. No India-specific consumer rival found, status UNKNOWN .
Validation insights	FACT One prototype (15 services, model-estimated scores). 0 users, interviews, surveys, waitlist, revenue. Day 22 scores: problem 4/10, founder-market fit 48/100, confidence Low.
What this blueprint changes	Day 22 showed the pain you scored highest is fear of fraud or account takeover , and "combined exposure view" scored last. The MVP therefore leads with "what to do first" and tests the fraud framing in interviews.

2. Ideal Customer Profile

ATTRIBUTE	PROFILE (FIRST WEDGE)	STATUS
Who	Final-year students and first-job professionals, 20–25, who use many apps and UPI daily	ASSUMPTION
Geography	India; colleges and tech communities you can reach directly	FACT
Technical maturity	Comfortable with apps, not security specialists. Include non-CS students, not only coders.	ASSUMPTION
Main pain	Does not know what to fix first; worries about scams or account takeover	ASSUMPTION
Budget	Low and irregular; expects free tools	ASSUMPTION
Buyer vs user	User is the individual. A possible second buyer is a college or employer (cyber-hygiene program). Budget UNKNOWN .	ASSUMPTION
Best early adopters	Students who have had, or know someone who had, an account or payment scare	ASSUMPTION

Your reach (coding communities, LinkedIn) skews to privacy-aware coders, who may overstate demand. Recruit at least half of interviewees outside that group.

3. Buyer Persona

Hypothetical archetype built from your answers. Not a real customer.

FIELD	ANANYA, 21, FINAL-YEAR NON-CS STUDENT (HYPOTHETICAL)
Background	Uses Instagram, YouTube, WhatsApp, Google apps, UPI and a shopping app daily on her own phone
Goals	Feel safe, avoid a scam, not waste time on settings
Pain points	Settings buried; unsure what matters; heard of friends' accounts being hacked
Current alternatives	Ignores it, follows one YouTube tutorial, asks a friend
Triggers	A scam attempt, a friend's hacked account, a campus cybersecurity session
Objections	"Why trust this score?" "I won't open it twice." "I won't pay."
Convinced by	A 2-minute result with three specific actions and visible sources

4. Top 10 Customer Pain Points

Priority is a 1–10 judgment **ESTIMATE**. Rows 1–5 and 7 repeat Day 22 averages. The rest are new, rougher scores with no data behind them.

#	PAIN POINT	PRIORITY	EVIDENCE TODAY	VALIDATE BY
1	Fear of fraud, scams, or account takeover	5.3	ASSUMPTION	Ask for the last scare and what they did
2	Don't know what to fix first	4.3	ASSUMPTION	Watch them try to improve one setting
3	Can't judge a new app before installing	4.0	ASSUMPTION	Ask how they chose their last new app
4	Unsure whether their data was in a breach	4.0	ASSUMPTION	Ask if they ever checked
5	Ads seem to know private conversations	4.0	FACT reported: nearly 2 in 3 Indian smartphone users (LocalCircles via Moneylife; sample and date not retrieved)	Ask what they did about it
6	Privacy policies are unreadable	3.8	ASSUMPTION	Ask when they last read one
7	No combined view across services and owners	3.5	ASSUMPTION (your core thesis)	Show the ownership view; ask if it surprises them
8	Permission prompts are confusing	3.0	ASSUMPTION	Ask what they usually tap and why
9	Privacy settings are hard to find or reset	3.0	ASSUMPTION	Time a task: "turn off X"
10	Unclear which company owns which service	3.0	ASSUMPTION	Quiz: "who owns Instagram, WhatsApp, YouTube?"

5. Customer Journey

STAGE	CUSTOMER ACTION AND THOUGHT	FRICTION	MVP RESPONSE	MEASURE
Awareness	Sees a scam story or a creepy ad. "Am I exposed?"	Feeling fades fast; few search for this	Share the test in campus and community groups at trigger moments	Visits per channel
Consideration	Opens the check-up. "Can I trust this, and is it worth 2 minutes?"	No visible sources; generic results	Sources page per service; three specific actions	Selection completion; trust rating
Purchase	Sees a priced "Pro" option. "Why pay when free tools exist?"	Free alternatives; low budget	Fake-door button only, after value is shown	Click rate on priced option
Retention	Gets a 7-day follow-up. "Did I do anything? Do I come back?"	One-time-use habit	Manual follow-up; day-14 return prompt	Action rate; day-14 return

6. Objections and Buying Triggers

Key objections **ASSUMPTION**

- **"Why trust your score?"** Test: trust rating with and without sources
- **"I won't act on it."** Test: action taken within 7 days
- **"Google and Apple already do this."** Test: ask what they have used and what yours adds
- **"I won't pay."** Test: fake-door click at ₹99/month and ₹499/year
- **"I'll use it once."** Test: day-14 return
- **"I won't share my app list."** Test: selection completion rate

Key buying triggers **ASSUMPTION**

- A friend's account is hacked or a scam attempt
- A breach notification
- An ad that "knows" a private conversation
- A new phone, first job, or KYC and banking setup
- Installing an unfamiliar app
- News on India's data-protection rules (notified 14 Nov 2025, phased over 12–18 months)

7. MVP Recommendation

Core hypothesis: an India-relevant, sourced "Privacy Check-up" that ends in three ordered actions will lead at least half of test users to complete one action within 7 days. **ASSUMPTION**

What to build first

- Reuse the prototype. Expand and fix the service list to 20–25 India-relevant services (for example PhonePe and Paytm; verify TikTok and PUBG status).
- A sources page: owner, data categories, policy link for each service.
- A result page: score, how it was calculated, and **three ordered actions**.
- A shareable result card that does not reveal the app list.
- A 7-day follow-up (manual message or form): "What did you do?"
- A landing page, waitlist, and a fake-door "Pro" button.

What NOT to build

- Account connections or data-export uploads (trust and DPDP exposure rise sharply)
- Mobile app or browser extension
- Logins, payments, or a real subscription
- AI-generated per-service claims without a source
- B2B or institution dashboards
- Global coverage, 100+ services, real-time tracking

Success metrics **ASSUMPTION (suggested thresholds, set before testing)**

METRIC	TARGET	TESTS
Interviews with a specific incident or setting change in the last 6 months	≥ 40% of 15	Problem is felt
Visitors who complete service selection	≥ 60%	Willing to share app list
Trust rating when sources are shown	≥ 4 of 5	Score is credible
Users who complete one action in 7 days	≥ 5 of 10	Plan is acted on
Day-14 return	≥ 20%	Retention potential
Clicks on the priced "Pro" option	≥ 5%	Willingness to pay
Institutions interested in a pilot	≥ 1 of 3	B2B route

8. MoSCoW Prioritization

Must have • Service picker with 20–25 India-relevant services • Per-service sources page (owner, data categories, policy link) • Score with a plain "how this is calculated" note • Top three ordered actions • 7-day follow-up and feedback form • Simple event counts only, with a short privacy notice	Should have • Company-ownership view (which services sit under one company) • Shareable result card without the app list • Landing page and waitlist • Fake-door "Pro" button
Could have • "Check a new app before installing" lookup • Day-14 email or message reminder • Mock "send a data-rights request" screen (tests pivot 2) • Hindi or other language support, if interviews ask for it	Won't have (now) • Account connections or export uploads • Mobile app or extension • Logins and payments • B2B dashboards • Unsourced AI-written claims

9. Pricing Hypothesis

TIER	HYPOTHESIS	TEST	STATUS
Free core	Check-up, sources page, top three actions stay free to maximize learning and sharing	Usage and action rate	ASSUMPTION
Individual Pro	Change alerts, new-app checks, ongoing plan. Illustrative ₹99/month or ₹499/year	Fake-door clicks; Van Westendorp questions in the survey	ASSUMPTION
Institution pilot	Cyber-hygiene program for a college or employer. Price UNKNOWN ; ask in conversations, do not guess	3 conversations	ASSUMPTION

FACT Anchors: Incogni Standard is \$95.88/year on annual billing, well above a typical student budget

ASSUMPTION . Jumbo's reported 40% annual churn warns against relying on individual subscriptions.

10. Top 5 Risks

#	RISK	LEVEL	MITIGATION
1	Score is not trusted or accurate. Estimates have no ground truth and could mislabel a company.	High	Cite a source for every claim; publish the method; ask one security practitioner to review
2	People see it but do not act or return.	High	Three actions only; 7-day follow-up; day-14 return test
3	Sampling bias and weak distribution. Your network skews to privacy-aware coders.	High	At least half of testers outside coding circles; track sign-ups per channel
4	No willingness to pay. Consumer privacy subscriptions have struggled.	High	Fake-door test; explore institutional route early
5	Data upkeep and scope creep. Policies change; adding accounts raises regulatory exposure.	Medium	Keep to 20–25 services; no connected accounts; revisit only after validation

11. 30-Day MVP Plan

DAYS	FOCUS	ACTIONS	DONE WHEN
1–7	Learn	Write script; run 15 interviews (≥ half outside coding circles); competitor teardown; send 10-question survey	15 interviews logged; ≥ 50 survey responses
8–14	Build MVP v1	Expand to 20–25 services with sources; three-action result page; shareable card; follow-up form; landing page	Sourced dataset and live check-up
15–21	Test	10 users get a concierge result and 7-day follow-up; post in three communities; fake-door pricing; 3 institution conversations	Action rate, trust, sign-ups, click rate recorded
22–30	Decide	Compare results with the metrics in Section 7; write a one-page decision memo; get one expert review of the method	Build, Pivot, or Pause decided

12. Founder Action Sheet: Top 10 Next Actions

#	ACTION	BY	DONE WHEN
1	Set pass thresholds (Section 7) in writing before testing	Day 1	Thresholds saved
2	Write a 20-minute interview script about past behavior; no pitching	Day 2	Script ready
3	List 30 candidates, at least 20 not close friends, 5+ outside tech	Day 2	List complete
4	Run 15 interviews	Day 6	15 logged with notes
5	Send a 10-question survey with price questions	Day 7	≥ 50 responses
6	Fix the service list: add PhonePe and Paytm, verify TikTok and PUBG status	Day 9	20–25 services listed
7	Add owner, data categories, and policy link for each service	Day 12	Every claim has a source
8	Build the three-action result page and follow-up form	Day 14	Live and tested by you
9	Run the 10-user concierge test and the fake-door pricing test	Day 21	Numbers recorded
10	Write the Build / Pivot / Pause memo and ask a security practitioner to review	Day 30	Decision made

13. Scores (0–100) ESTIMATE

Customer Clarity		35
Problem Severity		40
PMF Potential		30
MVP Readiness		45

SCORE	REASONING
Customer Clarity 35	A reasonable first wedge, but 0 interviews and a broad 18–30 range. Buyer for any paid version is unknown.
Problem Severity 40	Matches the Day 22 problem score of 4/10. Concern is reported, but urgency and payment are unproven.
PMF Potential 30	No demand signal yet, free alternatives exist, and the closest consumer precedent struggled. Low cost to test keeps it above 20.
MVP Readiness 45	A working prototype exists and needs no accounts. It lacks sourced data, India-relevant coverage, a follow-up mechanism, and any testers.

14. Final Verdict

Promising but Unvalidated (low end)

There is no measured demand signal, only general concern and a cheap path to test. The idea is worth a 30-day test because users are reachable and the MVP reuses what you built.

Moves up to  if ≥ 5 of 10 users act within 7 days and ≥ 40% of interviewees describe a real incident. **Drops to**  if fewer than 20% do, or if nobody outside your coding circle engages.
